1. Make sure your device’s Wi-Fi is turned on.
   a. If you need to do that, from the Home screen navigate to Settings > Wi-Fi.

2. Select UAWiFi.
   a. If this is the first time you’re connecting to the network, the UAWiFi option only shows if you’re within range.

3. For the EAP Method select PEAP.

4. If prompted for Phase 2 authentication select MSCHAPV2. If not, proceed to the next step.
5. You’re then prompted to choose the **Certificate**, which is how you confirm you’re connecting to a known and safe network. Select **Don’t validate**.
   a. **IMPORTANT:** If you **don’t** see a checkbox for “Don’t Validate”, click the drop-down and after “Domain” enter **arizona.edu**.

6. When you choose “don’t validate” your device states that “your connection won’t be private.” The UAWiFi does have a certificate and is a secure network but Android doesn’t load it automatically, which is why you need to choose “Don’t Validate.”
7. Enter your NetID (Identity) and NetID password (Password) then click Connect.

8. You’re now connected to the UAWiFi. Once you connect to UAWiFi the first time, you should only need to enter your username and password again if you have a new device or change your NetID or NetID password.
